

BindingGYM — the binding-site contrast the DMS measures is not the contrast ProteinMPNN predicts

A Per-assay interface contrast: prediction vs measurement

B Same statistic on the measurement (left) and the prediction (right)

black = measured DMS_score · teal = ProteinMPNN score · thick bar = median · number above = median shift

$\delta < 0$ = variants touching a binding site score lower. ProteinMPNN: zero-shot global_score, seed1 / M=5, scored on the WT complex. Binding site = heavy atom within 5 Å of a never-mutated partner chain.
