

BindingGYM — ProteinMPNN zero-shot score by whether a variant touches a binding site (same panel order as the DMS figure)

ProteinMPNN global_score, seed1 / M=5 (independent scale per panel; higher = more native-like) · panels sorted by the DMS Cliff's δ · red = the MPNN δ has the OPPOSITE sign to the DMS δ
 vertical lines = group medians · OVL = overlap coefficient (1 = identical distributions) · a group with $n < 10$ is not drawn · x-axis clipped to the 0.5-99.5 percentile
